

Thanks, Yash, for sharing. I have also had a similar experience previously where a vast amount of resources is required to resolve a threat that is determined as high. Still, when looking at the holistic view of the system, the danger is low compared to other threats present, which could have a more significant impact. There should be a team or process in place that looks at the scores, and some priority should be given based on the actual result of the impact. Following on from this point, an interesting article by Bellis discusses that CVSS scores are not making a granular distinction between critical vulnerabilities
