

Hi, Thank you, Gokul and Nkosana. I appreciate that you have made some excellent points in this discussion. One questionable factor is the scoring. I wanted to see the sheer volume of the threats and what the rating results have been like for any given year. I found that 32.7% of all

vulnerabilities discovered to date are under Critical or High severity. In 2021 alone, the National Vulnerability Database published a total of 20,141 vulnerabilities. [Garg, P 2022] I agree with Nkosana that for SecOps, this tool would be invaluable to identify threats quickly that are relevant to the organisation.
